

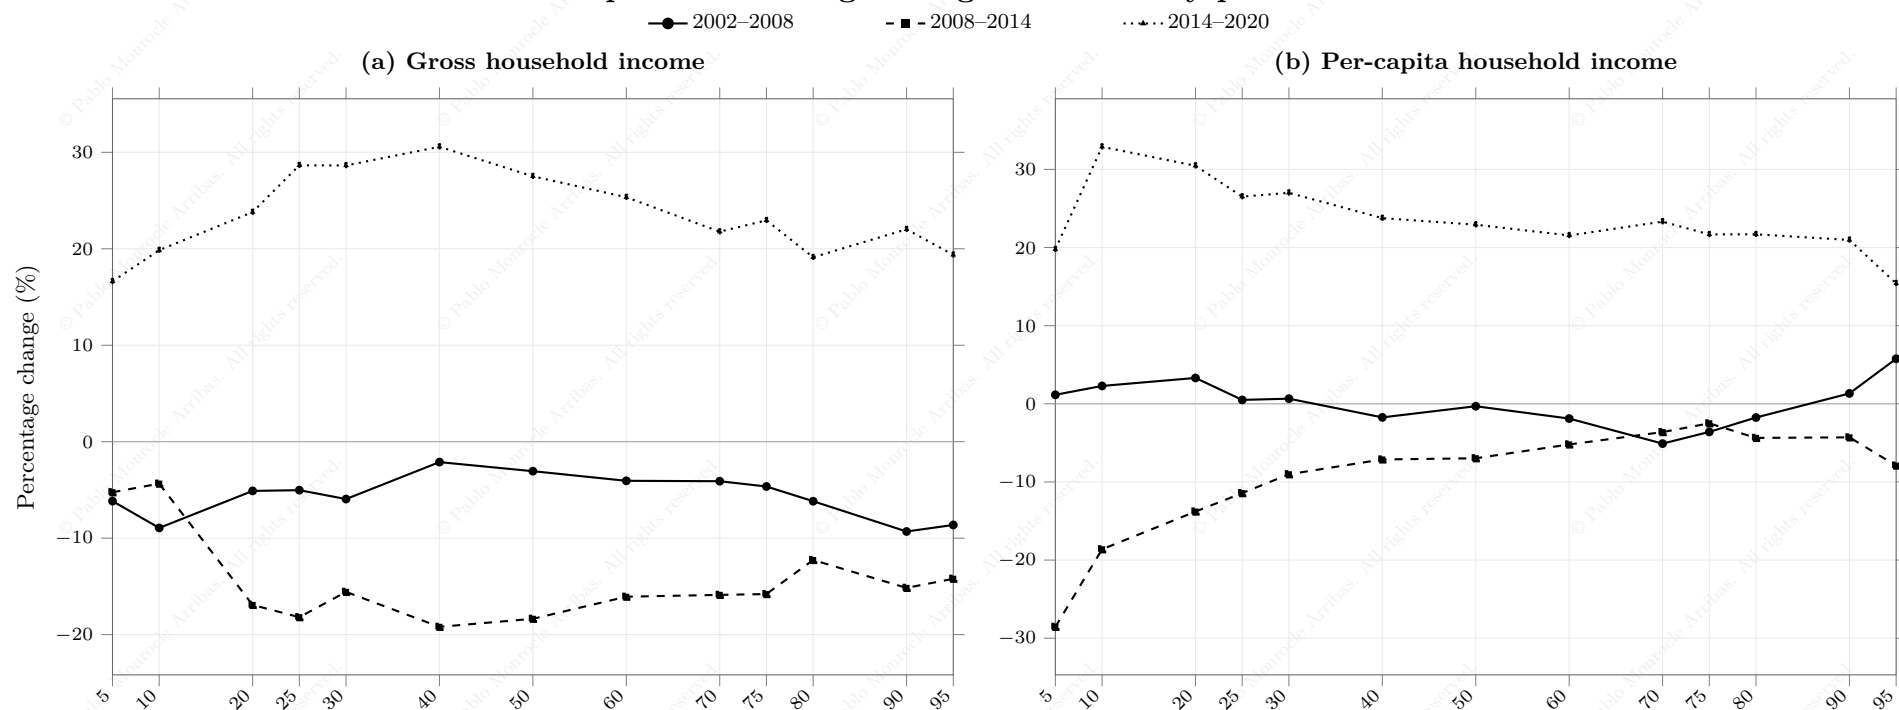

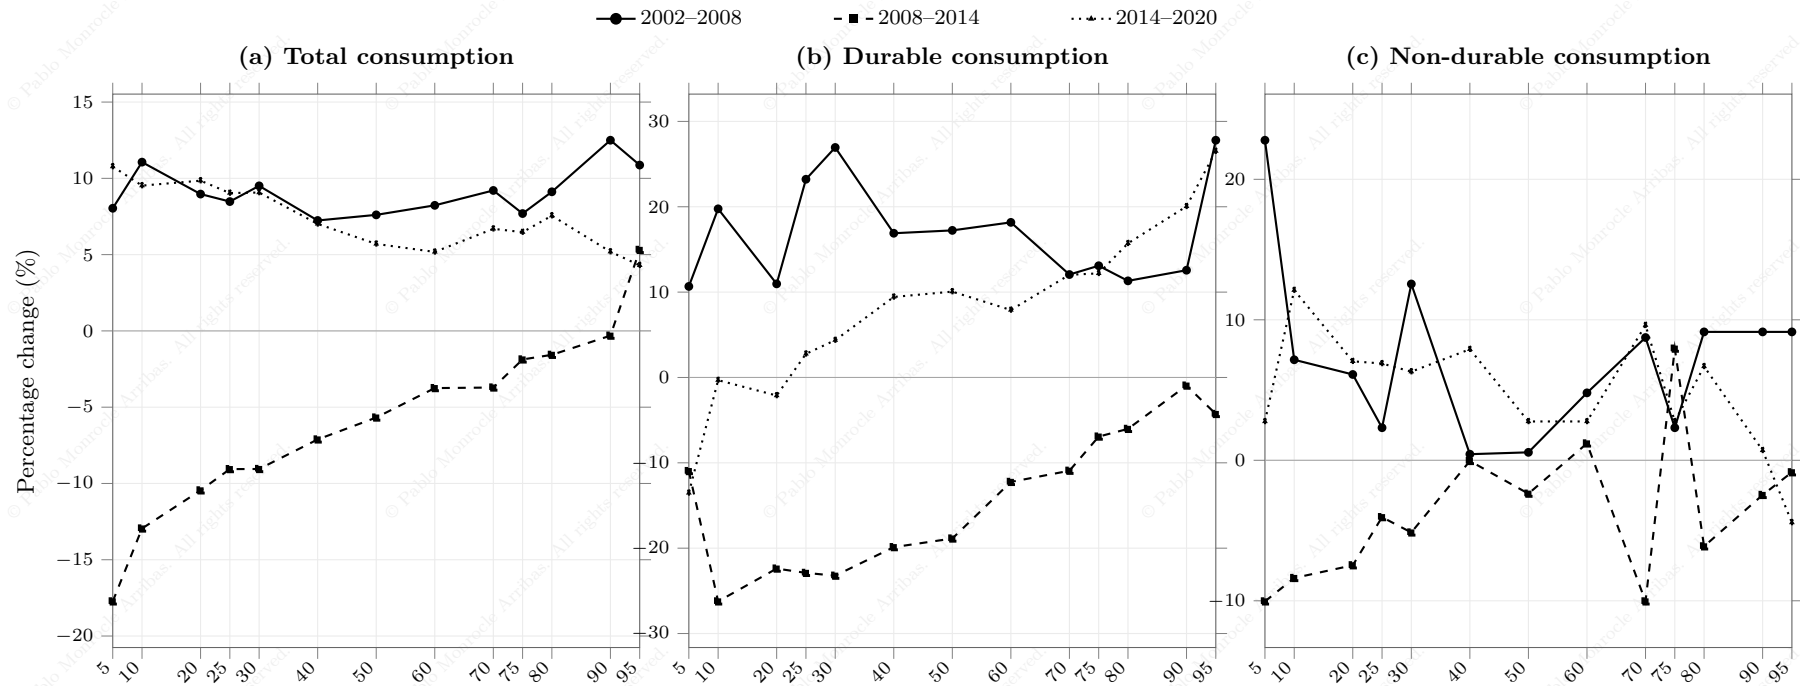

Graph 8. Percentage change in income by percentile

Source: Own elaboration from the Spanish Survey of Household Finances (EFF, Banco de España).

Notes: Percentile changes are computed as 100 times the difference between the weighted percentile in the final and initial wave, divided by the initial weighted percentile. The calculation uses household survey weights, positive non-missing values and real terms. Observations: 42,254 household-wave observations in the full panel; endpoint waves used in the figures are 2002, 2008, 2014 and 2020.

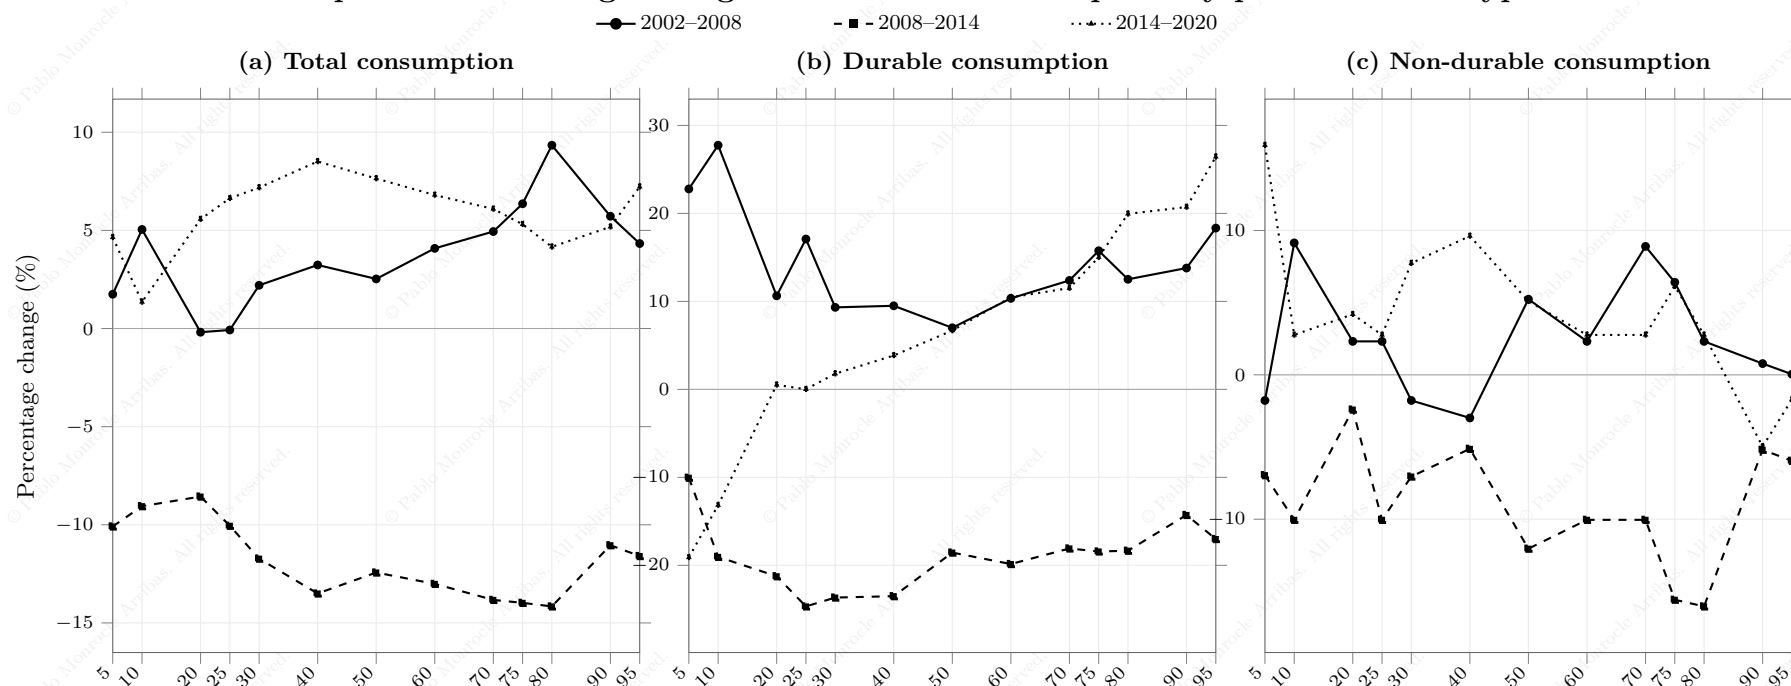

Graph 13.1 Percentage change in per-capita consumption by percentile and type

Source: Own elaboration from the Spanish Survey of Household Finances (EFF, Banco de España).

Notes: Percentile changes are computed as 100 times the difference between the weighted percentile in the final and initial wave, divided by the initial weighted percentile. The calculation uses household survey weights, positive non-missing values and real terms. Observations: 42,254 household-wave observations in the full panel; endpoint waves used in the figures are 2002, 2008, 2014 and 2020.

Graph 13.2 Percentage change in household consumption by percentile and type

Source: Own elaboration from the Spanish Survey of Household Finances (EFF, Banco de España).

Notes: Percentile changes are computed as 100 times the difference between the weighted percentile in the final and initial wave, divided by the initial weighted percentile. The calculation uses household survey weights, positive non-missing values and real terms. Observations: 42,254 household-wave observations in the full panel; endpoint waves used in the figures are 2002, 2008, 2014 and 2020.
