

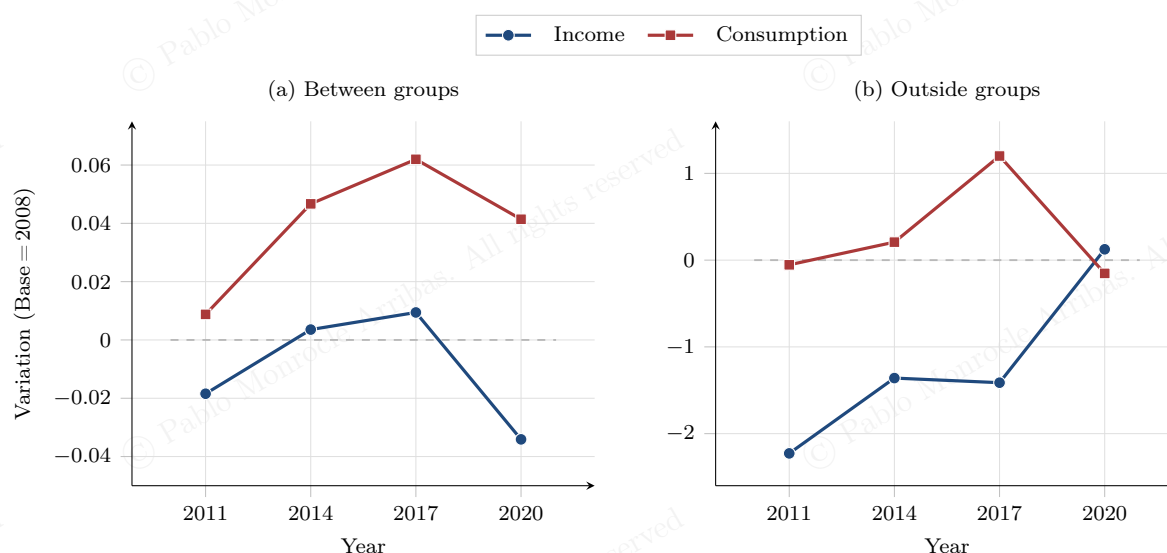

Graph 12. Evolution of income and consumption inequality between (a) and outside (b) groups (Base=2008)

Source: Elaborated by Pablo Monrocle Arribas from EFF (BdE) based on Krueger et al. (2006). Calculated with Stata14 MP and graph with excel. *Note:* Inequality in income and consumption was obtained by decomposing the total variance into two components of regressions that use demographic characteristics of households: between groups and within groups. The “intergroup” variance was obtained from the predictions, while the “within groups” variance was calculated from the residuals of the same regressions, capturing the dispersion not explained by the characteristics included in the model.
